

## GRAVITY SOFTWARE VS. SAGE 50CLOUD

# Grow faster and stay agile with a true cloud accounting solution for growing businesses

Sage 50cloud is a great starting point for small businesses with basic accounting needs, such as managing accounts receivable and accounts payable. However, it wasn't originally designed for multi-entity accounting, and it's not a true cloud-based accounting software. This means it's not equipped to support fast-growing companies with multiple entities and a need for agile, mobile-friendly solutions. For instance, users report experiencing disconnects and failures to sync data between the on-premise software and remote devices.

## Making the right choice for your business

While both Gravity Software and Sage 50cloud offer valuable accounting features, they cater to different business needs. Gravity Software provides a comprehensive, cloud-native solution ideal for growing businesses requiring robust multi-entity management and advanced accounts payable automation. Gravity also offers various payment capabilities, including ACH payments. Built on the Microsoft Power Platform, it offers real-time data access, seamless integrations, and advanced functionalities. In contrast, Sage 50cloud suits smaller businesses with basic accounting requirements but may present limitations as organizational complexity increases.

For businesses seeking a scalable, efficient, and fully integrated accounting solution, Gravity Software emerges as a compelling choice.

### Here are some primary differences between the two.

#### Cloud capabilities

As a cloud-native application, Gravity Software allows access from any location without the need for on-premises installations.

While Sage 50cloud offers remote data access through cloud-connected services, it is not a fully cloud-native solution. It relies on data syncing between desktop and cloud, potentially leading to errors or data loss. Achieving full cloud functionality requires additional hosting services, increasing overall expenses.

#### Multi-entity management

With Gravity Software, you can easily manage multiple companies within a single database, streamlining inter-company transactions and consolidated reporting.

Sage 50cloud has limited multi-entity capabilities, supporting up to 10 entities in certain versions.

## Integration with Microsoft Power Platform

Gravity Software is built on the Microsoft Power Platform, so it integrates seamlessly with Microsoft Office 365 applications, including Power BI for business intelligence and Power Automate for customizable workflows.

Sage 50cloud offers integration with Microsoft 365 at an additional cost.

## Scalability

With Gravity Software, you can easily manage multiple companies within a single database, streamlining inter-company transactions and consolidated reporting.

Sage 50cloud has limited multi-entity capabilities, supporting up to 10 entities in certain versions.

	Gravity Software	Sage 50cloud
Number of users	Unlimited	40 (Quantum version)
User definable dashboards	●	●
Personalized data entry screens	●	Limited
